World's first pre-assembled solar cooling unit unveiled

*Solarsa to build
4 megawatt Energy Parks™
On the roofs of our favorite restaurants*

And reduce our dependence on foreign oil

TAMPA, Fla. – Solarsa International Ltd. Co. announced September 5th the manufacturing of the first in a series of pre-packaged solar cooling systems based on technology developed and used by Santa Clara University for the 2007 Solar Decathlon. The Energy Independence System® 005 (EIS005) is the first pre-assembled, ready to install solar cooling system in the world.

"While solar thermal cooling is not ready for wide spread residential use, we are proud to tell you that the technology developed by Santa Clara University for the Solar Decathlon is being put to use in restaurants today" stated Scott Jorgensen, President and CEO from Solarsa.

Solarsa is installing, operating and maintaining the EIS005 for restaurants and hotels. Restaurant/hotel owners can save on both operating and maintenance cost without any capital investments because Solarsa owns the EIS005 and only charges clients for the energy that is used. Cooling, heating and hot water is provided as a service in much the same way as a linen company or dishwashing machine company provides their services to the hospitality industry.

With the introduction of the first pre-packaged solar cooling system, Jorgensen is targeting chain restaurants such as Applebee's, Culver's and Wendy's throughout the entire United States. "A single five ton unit in a hundred restaurants is equivalent to a 4 megawatt "peaking" power plant. 100 units would save \$1,000,000 dollars per year on fossil fuel purchases and prevent 8 million lbs (4000 tons) of carbon dioxide pollution released into the atmosphere each year. This is equivalent to planting 644 acres of trees every year. Discussions have begun with hospitality industry leaders and the jury is out on which restaurant group will be the first to roll out the program nationally," stated Jorgensen.

About Solarsa: Solarsa International Ltd. Co. is America's leader in solar cooling technologies. Solarsa, *a value-added renewable energy services company*, provides reduced and stable energy prices to clients' for heating, cooling and hot water. The energy services are provided exclusively by Energy Independence Providers® (franchisees) through energy services agreements to qualified clients.
